

SQL

SET OPERATORS

- UNION, UNION ALL, INTERSECT, MINUS
- For SET operators to work:
 - > You need 2 independent queries
 - > Same number of columns in Select statement
 - > Same data type in same order

UNION

- The **UNION** operator combines result sets of two or more **SELECT** statements into a single result set.

SELECT column 1, column 2... **FROM** Table1

UNION

SELECT column 1, column 2... **FROM** Table2;

UNION

- The following are rules applied to the queries:
 - Both queries must return the **same number** of columns.
 - The corresponding columns in the queries must have compatible data types.

UNION

- The **UNION** operator removes all duplicate rows unless the **UNION ALL** is used.
- We often use the UNION operator to combine data from similar tables that are not perfectly normalized.

UNION VS UNION ALL

Developers	UNION & UNION ALL	Testers	=	UNION	UNION ALL
Name		Name		Name	Name
Mike		Steven		Adam	Mike
John		Adam		John	John
Steven		Lex		Lex	Steven
Maria				Maria	Maria
				Mike	Steven
				Steven	Adam
					Lex

MINUS

- **MINUS** set operator returns records from first query that is not present in second query.
- It will only return values (from 1st query) that are not common in 2 queries

MINUS

- Let's say we have two query result.

Developers
Name
Mike
John
Steven
Maria

Testers
Name
Steven
Adam
Lex

MINUS

Developers
Name
Mike
John
Steven
Maria

MINUS

Testers
Name
Steven
Adam
Lex

=

Result
Name
Mike
John
Maria

SELECT Name **FROM** Developers
MINUS
SELECT Name **FROM** Testers

INTERSECT

- **INTERSECT** set operators returns records that are present/common/appear in both query results.
- It will sort and remove duplicates.

INTERSECT

- Let's say we have two query result.

Developers
Name
Mike
John
Steven
Maria

Testers
Name
Steven
Adam
Lex

INTERSECT

Developers
Name
Mike
John
Steven
Maria

INTERSECT

Testers
Name
Steven
Adam
Lex

=

RESULT
Name
Steven

```
SELECT Name FROM Developers
INTERSECT
SELECT Name FROM Testers
```

SUMMARY OF SET OPERATORS

- **UNION** -> combines, removes duplicates, sorts
- **UNION ALL** -> combines, does not remove duplicates, does not sort
- **MINUS** -> show records from query1 that are not present in query2
- **INTERSECT** -> show common records from 2 queries

SELF JOIN

- join the table to itself.
- We use self join when we want to combine rows with other rows in the same table.
- To perform the self join operation, **we must use a table alias** to help SQL distinguish the left table from the right table of the same table.

SELF JOIN

- Let's say we want to print out employee full name with their manager's name together.
- `SELECT` e1.first_name, e1.last_name, e1.manager_id, e2.last_name
`FROM` employees e1 `JOIN` employees e2
`ON` e1.manager_id = e2.employee_id;
